/note="Vector: Landad Uni-ZAP XR, excised phagemid phluescript SK; Site_1: BcoRL; Site_2: Xhol; Seeds were surface-sterilized, germinated and grown aseptically in the dark at room temperature on filter paper with water, nystatin and cefotaxime in covered crystallization dishes. Roots were harvested. The tissue, total RNA, and poly(A) RNA were prepared, a cDNA library was made in the TJ Close lab (Choi, Close, Fenton) at the University of callifornia, Riverside. The cDNA clones were in vivo excised to give phluescript phagemids before normalization was carried out. The mass excision of phagemid library and normalization were done in HT Nguyen lab by D. Zhang at Texas Tech University. Normalization protocol used was that of Soares'. Plasmid DNA protocol.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    preparations and DNA sequencing were performed in the Anderson lab (all other authors)." 170~c~161~g~83~t

NOTE: It currently consists of 1 contigs. Gaps between the contigs are represented as runs of N. The order of the pleces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submitter. This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

* NOTE: This is a "working draft' sequence."
